# The problem: Efficient Market Hypothesis

Friedman or Alchian argument is twofold

- irrational traders perform badly and are driven from the market
- rational traders drive the prices to their fundamental values

(ロ) (同) (三) (三) (三) (○) (○)

## Overview

We investigate wealth-driven selection in incomplete asset markets populated by heterogeneous investors without perfect foresight assumption.

- Which investment rules (beliefs & preferences, ...) does the market reward?
- Does it exist a dominant rule?
- Can investment behaviors be "ordered"?
- Is agents' heterogeneity a persistent property?
- What are the consequences for asset prices?
- Do asset prices reflect the most accurate beliefs?

We provide answers a simple, but rich enough (stochastic, behaviors/rules, equilibrium prices), analytically tractable model by studying the local stability of market selection equilibria.

### The Model: Assets

Discrete time. *S* possible states of the world realized with fixed probability  $(q_1, \ldots, q_S)$  at each *t*.  $\Omega$  space of sequences  $\omega = (\omega_1, \ldots, \omega_t, \ldots)$ . Stationary and ergodic process.

Repeated exchange of *K* short-lived assets which represent contingent claims on future (uncertain) dividends. Asset *k* payoff at time *t* is  $D_{k,s}$  if  $\omega_t = s$ . *D* is the dividend matrix, full rank (in particular no zero rows, no zero columns).  $P_{k,t}$  is price of asset *k* at time *t*.

$$D = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}, D = \begin{pmatrix} 1 & 0 \\ 0 & 2 \end{pmatrix}, D = \begin{pmatrix} 1 & 1 \\ 2 & \frac{1}{2} \end{pmatrix}, D = \begin{pmatrix} 1 & 0 & \frac{1}{2} \\ 0 & \frac{1}{2} & 2 \end{pmatrix}$$

### Prices and Wealth Dynamics

 $W_t^i$  is the wealth of agent *i* at time *t*. A fraction  $\alpha_{k,t}^i$  is invested to buy  $h_t^i = \alpha_{k,t}^i W_t^i / P_{k,t}$  shares in asset *k* while  $1 - \sum_k \alpha_{k,t}^i$  is consumed. By Walrasian market clearing

$$1 = \sum_{i} h_{k,t}^{i} \Leftrightarrow \mathcal{P}_{k,t} = \sum_{i} \alpha_{k,t}^{i} \mathcal{W}_{t}^{i}.$$

Wealth at time t + 1 depends on the realization of the state of the world  $\omega_{t+1}$ 

$$W_{t+1}^i = \sum_{k=i}^K \frac{\alpha_{k,t}^i W_t^i}{P_{k,t}} D_{k,\omega_{t+1}}.$$

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

## **Background Literature**

Simple, "exogenous", rules (wealth fractions depend only on dividend process)

- Blume and Easley (1992) *Evolution and Market Behavior*. Market for Arrow securities and simple rules. Selection rewards log preferences with beliefs "closest" (relative entropy) to π. Relative entropy defines order relation. (in background Log-optimality: Kelly, 1956; Breiman, 1961).
- *Evolutionary Finance* (a survey Evstigneev, Hens, and Schenk-Hoppe', 2009). Simple rule in an extended framework (long-lived assets, possibly incomplete markets, more general dividend and learning processes). G-Kelly rule, i.e. invest proportionally to expected dividends, is global maximum w.r.t. order relation.

## **Related Literature**

Non-simple, "endogenous", rules (wealth fractions depend on dividend and price process)

- Sandroni (2000) and Blume and Easley (2006): general demands, infinite horizon, perfect foresight on prices, dynamically complete markets. Find that Pareto optimality implies that, controlling for discount rates, best beliefs (relative entropy terms) gain all wealth in long run.
- Some finance applications of Heterogeneous Agents Models (Hommes 2006) and Agent Based Computational Economics (LeBaron 2006) study wealth-driven selection of CRRA rules in deterministic/simulation framework. Partial equilibrium framework. Levy, Levy, Solomon (1994, 1995, 2000), Chiarella et al (2001, 2006), Le Baron (2012). Behavioral Finance.

# **Our Framework**

- Short-lived assets (K)
- Endogenous investment rules (I) (L)
- No perfect foresight (incompletness)
- Repeated trade in discrete time, temporary equilibrium
- Random Dynamical System  $(I) \times (K) \times (L)$
- Local (and global) stability analysis of long-run market selection equilibria

Today we discuss:

- Local stability analysis (hint global)
- Market selection landscape depends on the ecology of traders, no ordering
- Heterogeneity may be persistent (time varying)
- Asset prices may not reflect beliefs of best informed agent
- Never vanishing rule exists

## **Investment Rules**

Generalized CRRA

Agent *i* invests on asset *k* at time *t* a fraction  $\alpha_{k,t}^i$  of her wealth. We assume that, given a time-independent function of assets' prices,  $\alpha_k^i$ , it holds

$$\alpha_{k,t}^{i} = \alpha_{k}^{i}(\mathbf{P}_{t}, \mathbf{P}_{t-1}, ...; D, \pi) \quad k = 1, ..., K,$$
 (1)

where  $\mathbf{P}_t$  is period *t* price vector (CRRA included, CARA excluded).

- P1 Each agent *i* consumes in  $[0, W^i)$ , or  $\sum_{k=1}^{K} \alpha_k^i (\mathbf{P}_t, ...) = \delta_t^i = 1 - \alpha_{0,t}^i \in (0, 1];$
- P2 Portfolios are maximally diversified, or  $\sum_{k=1}^{K} \alpha_k^i (\mathbf{P}, ...) D_{k,s} > 0$  for every *s* and *i*.
- **P3** Demand is strictly positive for zero contemporaneous prices, that is, for every asset *k* and agent *i*,  $\alpha_k^i(\mathbf{P}_t, ...)/P_{k,t} \rightarrow c > 0$  if  $P_{k,t} \rightarrow 0$ .

Normalizations leads to:

$$\sum_{k} d_{k,s} = 1, \quad \sum_{i} w_t^i = 1, \quad \sum_{k} p_{k,t} = \sum_{i} (1 - \alpha_{0,t}^i) w_t^i \quad \text{for all } t$$

Normalized inter-temporal budget constraint  $\omega_{t+1}$ 

$$w_{t+1}^{i} = \sum_{k} \frac{\alpha_{k}^{i}(\mathbf{p}_{t},\ldots;D,\pi)d_{k,\omega_{t+1}}}{p_{k,t}} w_{t}^{i}.$$

Normalized Walrasian market clearing

$$p_{k,t} = \sum_{i} \alpha_k^i (\mathbf{p}_t, \ldots; D, \pi) w_t^i$$

A price dependent generalization of the Kelly rule

Define the function

$$I_{\pi}(\alpha, \mathbf{p}) = -\sum_{s=1}^{S} \pi_{s} \log \left( \sum_{k=1}^{K} \frac{\alpha_{k}}{p_{k}} d_{s,k} \right) ,$$

where *d* is the normalized dividend payoff matrix and  $\pi$  the invariant measure.

We define  $\alpha^{S}$  as

$$\alpha^{S}(\mathbf{p}) = \operatorname{argmin}_{\alpha \in \Delta_{c}^{K}} \{ \exp I_{\pi}(\alpha, \mathbf{p}) \} .$$
(5)

If D = I, Arrow securities, then  $\alpha^{S} = \pi$ .

A price dependent generalization of the Kelly rule

Define the function

$$I_{\pi}(\alpha, \mathbf{p}) = -\sum_{s=1}^{S} \pi_s \log \left( \sum_{k=1}^{K} \frac{\alpha_k}{p_k} d_{s,k} \right) \,,$$

where *d* is the normalized dividend payoff matrix and  $\pi$  the invariant measure.

We define  $\alpha^{S}$  as

$$\alpha^{S}(\mathbf{p}) = \operatorname{argmin}_{\alpha \in \Delta_{c}^{K}} \{ \exp I_{\pi}(\alpha, \mathbf{p}) \} .$$

## Evolutionary stability and $\alpha^{S}$

#### Theorem

Consider an ecology  $\mathcal{E}$  of rules with  $\alpha^S \in \mathcal{E}$ . All deterministic fixed points  $x^* = (w^*, p^*)$  where  $\alpha^S$  vanishes are unstable. Moreover, there exists at least one stable deterministic fixed point in which  $\alpha^S$  survives and long-run asset prices are equal to  $p_k^* = \sum_{s=1}^{S} \pi_s d_{s,k}$ , for all  $k = 1, \ldots, K$ .

## Evolutionary stability and $\alpha^{S}$

#### Theorem

Consider an ecology  $\mathcal{E}$  of rules with  $\alpha^S \in \mathcal{E}$ . All deterministic fixed points  $x^* = (w^*, p^*)$  where  $\alpha^S$  vanishes are unstable. ## **Ongoing Work and Open Issues**

Open issues:

1. Global results (NHRW); for the log-otptimal rule see

- 2. Aggregate risk, see
- 3. More general demands (CARA, ...)
- 4. General learning
- 5. Long lived assets (endowments)
- 6. Wealth-driven selection and stylized facts
  - excess volatility
  - excess covariance
  - equity premium puzzle
  - <u>ا ا</u>

#### Summer School of Mathematics for Economics and Social Sciences

16 - 20 September 2013

The "Summer School of Mathematics for Economics and Social Sciences" anis to improve the knowledge of mathematical methods among graduate students in economics and social sciences, with a focus on those techniques which ableet widespread in use are not properly covered in typical graduate programs. The School is an interdisciplinary venue intended to foster the interaction of people's control for the too often separated communities of mathematical and social scientists. It is organized by the Mathematics Research Center "Ennio De Giorgi" and supported by the International Doctoral Program in Economics of the Scuola Superiors Bant/ana.

 Dates:
 from 16 to 20 September 2013

 Venue:
 Conservatorio di Santa Chiara, San Miniato, Italy

 Topics:
 Information theory, chaos and ergodicity with application to data analysis

 Lecture:
 Stefano Marmi, Scuola Normale Superiore, Pisa

 Fabrito Lillo. Scuola Normale Superiore, Pisa

#### Participation

The participation is subject to a selection. Only 20-25 positions are available. Financial support for board and accommodation will be provided.

On-line applications should be made at http://crm.sns.it/event/276/financial.html

School in San Miniato: http://crm.sns.it/event/276/
